

GreaterAntillesMap:

A mineral occurrence database for the Greater Antilles

Instructions for MapInfo and ArcGIS users

November 2016

Carl E. Nelson, president
Recursos del Caribe, S.A.
2360 23rd Street
Boulder, Colorado 80304
nelson@cbmap.net

Introduction

GreaterAntillesMap is a GIS database for the Dominican Republic, Haiti, Puerto Rico, Jamaica, Cuba and the Virgin Islands. The *Geography* module provides files for digital topography (DEM), shaded relief, and bathymetry. *Geology* provides an up-to-date geologic map for each country in vector format. *TS Units* provides a tectono-stratigraphic interpretation for the entire region based on published research. *Prospect* assembles current figures on past production, resources and reserves for 800 metallic mineral occurrences. *Land Status* locates 1300 metallic and non-metallic mineral concessions (attributed with ownership and contract date) and plots the locations of 500 national parks, forest reserves, and other areas of restricted mineral entry. *Geochemistry* assembles multielement rock and stream sediment geochemical data for the entire region.

GreaterAntillesMap is available in MapInfo or in ArcGIS format; pricing is covered on the last page of this database description. A reference list and copies of the sources used to assemble GreaterAntillesMap are provided with the database. GreaterAntillesMap is constantly being revised and updated as new resources are announced for an ever increasing number of metallic mineral occurrences. Geologic maps are updated and tectono-stratigraphic units are modified to reflect ongoing research in the region.

New users should pay special attention to the “Installation” and “Microsoft Access Database” sections of this Readme file. After installing GreaterAntillesMap, open “GAProspects” to display mines and mineral occurrences on a tectono-stratigraphic base map prepared from a mosaic of published country-scale geologic maps. Open “GALandStatus” to display metallic and non-metallic concessions along with national parks, national forests, and other areas of restricted mineral entry.

Geography, Geology, TS Unit Modules

The *Geography* and the *Geology* modules of the GreaterAntillesMap database are displayed by opening the “GAGeography” and “GAGeology” files. *Geography* includes shaded relief and bathymetry and is accompanied by Digital Chart of the World (DCW) files, topographic map indices and Landsat satellite imagery. *Geology* provides a mosaic of published geologic maps and legends (one for each country) all in vector format. The *TS Units* module produces a coherent regional geologic map by assigning tectono-stratigraphic units (e.g. mid-ocean ridge basalt) that supplement country-specific lithologic units (e.g. Rio Verde basalt). The *Geography*, *Geology* and *TS Units* modules have broad application beyond the mining industry.

Radiometric Dates Module

The *Radiometric Dates* module compiles over 650 published radiometric ages along with sample number, sample location, description, analytical method, mineral dated, error and a reference to the literature.

Prospect Module

The *Prospect* module, which includes the *Geography*, *Geology*, *Radiometric Dates* and *TS Units* modules, can be displayed by opening the “GAProspects” file. Metallic mineral occurrences are plotted using shapes that correspond to deposit types, colors for each metal, and sizes that reflect gross contained metal value. Clicking on a prospect with the info tool will call up attached information including location, source of data, deposit type, owners, partners, past production, current resources, current reserves, status (active mine, inactive mine, prospect), drill results, geologic observations, recent sales and joint ventures, and references to the literature as well as calculated values for total precious metal content in ounces, total base metal content in tons, and total contained metal value in US dollars.

GreaterAntillesMap can be queried. For instance, one can select:

- all gold deposits with over 500,000 ounces in past production, or
- all porphyry copper occurrences located in Puerto Rico, or
- all mineral occurrences hosted by ultramafic rocks.

Land Status Module

Land status is displayed by opening the “GALandStatus” file. Metallic and non-metallic mineral concessions, color-coded and plotted on a shaded relief base map, are attributed with concession type, ownership,

status, contract date, and expiration date. Only official government records are used to generate the concession maps. These maps provide a “snapshot” of land status as of the last compilation date. For specific areas of interest, a thorough review of current concession status is always necessary.

The land status database also shows areas of restricted mineral entry. These are areas such as national parks, forest reserves, Indian reservations, and national monuments where mineral exploration and development is restricted or prohibited.

Subdirectories

Concessions subdirectory:

Concession location information for the Greater Antilles is stored in the concessions subdirectory but is not updated regularly. Each concession is attributed with the contract date, ownership, and the expiration date (the contract date plus the maximum number of years that a concession can be held). Expired concessions are not eliminated until they disappear from the official government database. In some countries, expired concessions are active until a new or the old concession holder applies for cancellation. For up-to-date concession information, the user is referred to the Mines Department in each country.

Geology subdirectory:

The Geology subdirectory contains a 1:2.5M scale regional geologic map for the entire Caribbean region as well as detailed geologic maps for each country. All country-scale geologic maps have been digitized and are provided as vector files. Many of the original maps are difficult to obtain and/or out of print. The scale of the source maps varies from 1:250,000 (Haiti, Jamaica, Puerto Rico) to 1:500,000 (Cuba, Dominican Republic).

Prospect subdirectory:

Prospect information is stored in a Microsoft Access database (CBPros1.mdb) located in the prospect subdirectory. Only non-confidential information (published or generally available to the public) is provided.

The prospect database includes the following information for each mineral occurrence: name, alternate names, location, reference for location, deposit type, district name, owners, partners, deals, production, production period, production reference, reserve, reserve reference, resource, resource reference, status (active mine, inactive mine, resource, prospect), geologic

observations, size in ounces of gold and silver, size in tons of base and other metals, and gross contained metal value.

Mineral occurrences are classified as follows below. Symbols can be added and classifications can be modified at the user's discretion.

Metallic Mineral Deposit Classification

Deposit Type	Symbol
Epithermal veins and stockworks (Au, Ag, Cu, Pb, Zn)	1
Epithermal high sulfidation deposits (Au, Ag, Cu, Zn)	13
Epithermal veins and stockworks of Hg and Sb	8 (Hg), 10 (Sb)
Volcanogenic massive sulfide (VMS) deposits	2
Sediment-hosted (Sedex) deposits	14
Volcanogenic (Seafloor) manganese deposits	9
Porphyry (Cu, Mo, Au, Ag) deposits	5
Skarn and carbonate replacement deposits (Cu, Pb, Zn, Fe)	3
IOCG deposits	16
Orogenic (shear-hosted, mesothermal) deposits	4
Magmatic segregation (chromite) deposits	11
Lateritic nickel-cobalt deposits	6
Bauxite (aluminum) deposits	12
Alluvial gold, diamond and Pt group mineral deposits	7
unassigned	99

Parks subdirectory:

The parks subdirectory contains national parks, forest reserves, and Indian reservations by country. These are areas where mineral development is prohibited or restricted.

SS Survey Indices and Geophysical subdirectories:

The files in these subdirectories show the location of stream sediment surveys and geophysical surveys conducted by companies, governments and international aid organizations. Stream sediment survey indices show the number of samples collected, the area covered, the sample density, a list of the elements run, and the source of the data. Geophysical survey indices

show the type of survey (magnetic and/or radiometric), the area covered, and the source of the image or data.

Geochemistry and Geophysics subdirectories:

Multielement stream sediment survey data for Central America and the Caribbean region has been captured and digitized (as vector files). These vector files are accompanied by sample location maps (as georeferenced tiff images) and by pdf copies of the original survey reports and appendices. An index of the available stream sediment data can be downloaded at:

<http://www.cbmap.net/images/caribbean-stream-sediment-surveys-summary.pdf>.

Airborne geophysical images including digital data, as grd files, have also been preserved.

The supplemental Geochemistry and Geophysics subdirectories are designed to work in conjunction GreaterAntillesMap but are not included as part of the GreaterAntillesMap database. Pricing for Geochemistry and Geophysics databases is provided on the final page of this document.

Shaded Relief and Bathymetry subdirectories:

A shaded relief map and a bathymetric map for the Greater Antilles are provided in the shaded relief and bathymetry subdirectories. Ninety-meter (3 arc-second) resolution data used to create shaded relief maps for each country comes from version 2 (2005) of the Shuttle Radar Topography Mission (SRTM), available at <http://seamless.usgs.gov>. Regional elevation and bathymetric data (DEM files) used to create bathymetry and shaded relief maps that cover all the entire Caribbean region were downloaded from the Marine Geoscience Data System: Global Multi-resolution Topographic Data portal (MGDS: GMRT) at <http://www.marine-geo.org/portals/gmrt/>.

MGDS: GMRT data is compiled from a variety of sources of varying resolution. The regional bathymetric and shaded relief maps provided with GreaterAntillesMap were produced by taking the data provided by MGDS: GMRT and re-gridding it to produce maps at an approximate resolution of 200m (up to 240m depending on location).

DCW, Satellite and 50K topo index subdirectories:

The DCW subdirectory includes borders, cities and towns, roads, major drainages, and principal topographic contours from the Digital Chart of the World. Landsat satellite images, compressed using Mr. Sid software, are assembled in the Satellite subdirectory. Indices to published 1:50,000 scale topographic maps are provided in the 50K topo index subdirectory.

UTM subdirectory:

A UTM index is provided for all of the Greater Antilles along with grids for each UTM zone. Grids are provided for the following projections: 1) Latitude/Longitude (Equidistant Cylindrical) projection using the WGS 1984 datum, 2) Lambert Conformal Conic projection (origin latitude 39 degrees north, origin longitude 96 degrees west, standard parallels 33 and 45 degrees north) with the NAD 1927 datum, and 3) MapInfo's Latitude Longitude (Equidistant Cylindrical) projection using no datum.

Radiometric Dates:

The Radiometric Dates subdirectory compiles radiometric dates for over 650 samples. Each sample is attributed with sample number, location, lithology, sample description, analytical method, rock type, material dated, age, error, interpretation and source reference.

TS Units subdirectory:

This subdirectory contains files used to build a regional tectono-stratigraphic map, based on the geologic map, on publications and on graduate school theses. Copies of these publications are provided in the References subdirectory.

References:

The References subdirectory contains copies of the publications that were used in the preparation of the GreaterAntillesMap database.

Titles and legends subdirectory:

Title blocks, legends, grids, labels, and scale bars are stored here.

Installation (MapInfo Users)

Start by checking that Microsoft Access 2000 (or higher) and MapInfo version 10.0 (or higher) are installed on your computer. If this is an update, backup your previous version of the GreaterAntillesMap database and then erase the old database. Copy the new database from the GreaterAntillesMap Database DVD to the root directory (C:\) of your hard drive. Rename the folder CBMap (C:\CBMap).

Fonts

Next, you will need to follow these steps to replace your “MapInfo 3.0 Compatible font” with a customized font file provided with this version of the GreaterAntillesMap database.

- Exit MapInfo if it is running.
- Be sure that you are displaying hidden files and folders.
 - On a machine that is running Windows 7, go to the Organize Menu. Then select “Folder and Search Options” and select the “View” tab. Then, under “Hidden files and folders” select the option to “show hidden files, folders and drives”.
 - On a machine that is running Windows XP, on Windows Explorer, go to the “Tools” Menu and choose “Folder options.” Then select the “View” tab and, under “Hidden files and folders” select the option to “show hidden files, folders and drives”.
- Locate the file MAPINFOW.FNT on your computer.
 - On a machine that is running Windows XP, it is found in:
"C:\Documents and Settings*YourUserName*\ApplicationData\MapInfo\MapInfo\Professional\1000" (for version 10.0 of MapInfo)
 - On a machine that is running Windows 7, it is found in:
"C:\Users*YOURUSERNAME*\AppData\Roaming\MapInfo\Professional\1000" (for MapInfo version 10.0 users)
- Rename MAPINFOW.FNT; call it MAPINFOW_FNT.OLD
- Copy "MAPINFOW.FNT" from the GreaterAntillesMap root directory into the folder where "MAPINFOW_FNT.OLD" is located.

Datums

GreaterAntillesMap map uses several local datums that are not delivered with standard MapInfo software. Although the database will continue to function without making any changes, it is preferable to add the custom datums provided with GreaterAntillesMap to the MapInfo projection file.

Use any text editor to open “MapInfow.prj” from:

C:\Program Files\MapInfo\Professional (for Windows XP) or

C:\Program Files(x86)\MapInfo\Professional (for Windows 7)

This file contains all of the projections that ship with MapInfo. Copy the text from “add_to_mapinfow_prj_file.txt” on the GreaterAntillesMap DVD and paste it into MapInfow.prj (at the end of the file will work just fine) and save the revised MapInfow.prj. MapInfow.prj will now provide all local datums called by GreaterAntillesMap.

You are now ready to run GreaterAntillesMap. Open the prospects database and metallogenic map by opening GAProspects. Open the land status database and concession map by opening GALand Status.wor. You can also create your own workspaces (MapInfo).

Picklists

GreaterAntillesMap map uses a MapInfo Discover picklist to assign colors to tectono-stratigraphic units. Although neither Discover nor the picklist is required to run GreaterAntillesMap, users who want to edit the picklist (to change colors or to add TS units) will need to add the Discover module to MapInfo and copy the picklist (r_TectStrat_picklist.xml) from the TS Units\Picklist subdirectory of the GreaterAntillesMap database to the C:\Users\username\AppData\Roaming\Encom\Discover\Picklists subdirectory on the user’s computer.

Installation (ArcGIS Users)

Install Microsoft Access 2000 (or higher) and ArcGIS version 10.0 (or higher) on your computer. If this is an update, backup your previous version of GreaterAntillesMap and erase the old directory. Copy the new database from the GreaterAntillesMap Database DVD to the root directory (C:\) of your hard drive. Rename the folder CBMap (C:\CBMap).

If the GreaterAntillesMap database is copied to a location other than the root directory, then some of the project files will not open properly. Broken links can be re-established using the procedure described in a following section, Open Database Connectivity - ODBC Issues (ArcGIS Users).

You are now ready to run GreaterAntillesMap. Open the prospects database and metallogenic map by opening GAProspects.mxd. Open the land status database and concession map by opening GALandstatus.mxd. You can use the mxd files provided with the GreaterAntillesMap database or create new ones.

Microsoft Access Database (MapInfo and ArcGIS Users)

All prospect information is stored in a Microsoft Access database, CBPros1.mdb, located in the Prospect subdirectory. CBPros1, a table in the Access database, compiles relevant information for each mineral occurrence including: location, deposit type, owners, partners, past production, current resources, current reserves, published sources for past production, resource and reserve figures, status (active mine, inactive mine, prospect), salient drill results, geologic observations, ownership, terms of recent sales and joint ventures, and references to the literature. Calculated fields show the total precious metal content in ounces, base metal content in tons, and total contained metal value in US dollars.

New mineral occurrences can be added and changes can be made to existing mineral occurrence information by using MSAccess to modify the CBPros1 table. CBPros1.mdb also contains a series of queries that select all deposits for each of the deposit types shown on page 3.

A Microsoft Access Form, "Update Deposit Size and Value" must be used to update gross contained metal values whenever changes are made to production, resources or reserves. This form can also be used to change the metal prices used in the calculation of gross contained metal value.

The file called "readme_calculatedfields.txt" (located in the Prospects subdirectory,) lists the fields which are used in calculation of deposit size and gross contained metal value.

When working with the MSAccess database (CBPros1.mdb), any nulls (empty fields) should be replaced with zeros (0's) in the entries for production, resource and grade since the calculation of deposit size and value draws numeric values from those fields.

Deposit size and gross contained metal value are calculated using the following formulas:

Au and Ag deposit size = past production in ounces + (resource in metric tonnes * resource grade in ppm * 1/31.1034768) + (reserve in metric tonnes * reserve grade in ppm * 1/31.1034768)

Base metal, Aluminum, Nickel, Cobalt and Chromium deposit size = past production in tons + (resource in tonnes * 2204.623 / 2000 * resource grade in percent / 100) + (reserve in tonnes * 2204.623 / 2000 * reserve grade in percent / 100)

Deposit value = deposit size (in ounces for precious metals, in tons for base metals, aluminum, nickel and cobalt) * metal price. Polymetallic deposit values represent the sum of each of the contained metals.

ODBC (Open Database Connectivity) Issues (MapInfo Users)

MapInfo connects to the Prospects database (CBPros1.mdb) via a dsn file (CBPros1.dsn) which resides in the Prospect subdirectory. All changes made to the database in MapInfo automatically flow through to the Access database when the MapInfo table CBPros1.tab is saved. You can also make changes directly to CBPros1.mdb, the Prospects database, via MS Access.

ODBC (Open Database Connectivity) Issues (ArcGIS Users)

ArcGIS connects to the Prospects database (CBPros1.mdb) via an Object Linking and Embedding data base (OLE DB) link that is embedded in each mxd file. The OLE DB file, CBPros1.odc, resides in the ODCfile subdirectory of the Prospect subdirectory.

If any mxd files contain OLE DB links that are broken, those links can be re-established using ArcCatalog. Open ArcCatalog, right click on the mxd file that is not opening properly, select “set data source(s),” and set the data source as: C:\CBMap\Prospect\ODCfile\CBPros1.odc. ArcCatalog will then save the modified mxd as a “Copy of” the old filename.

Database Management System - DBMS (MapInfo Users)

All mineral occurrence information is stored in CBPros1.mdb, a Microsoft Access database located in the Prospects subdirectory. Changes made to CBPros1.mdb from within MapInfo are written to the MSAccess database when the MapInfo table is saved. (MapInfo may ask you to browse to the location of the MSAccess database.) Once changes have been saved to the MSAccess database, MapInfo will give you the option to “refresh” the linked MapInfo table. Answer “yes.” If inconsistencies arise between the data in the Access database and the data in the MapInfo tables, MapInfo will issue a warning message that prompts the user to resolve the conflict.

It is best to refresh all of the MapInfo tables, including CBPros1.tab, whenever changes are made to the mineral occurrence information whether from within MapInfo or from within Microsoft Access. After refreshing the MapInfo linked tables, close any open DBMS connections using “file > close DBMS connection” or the “disconnect DBMS” button.

MapInfo cannot read MSAccess queries. For this reason, deposit type selections are saved not only as queries in the MSAccess database but also as linked MapInfo tables in the Prospects subdirectory. Workspaces read the linked tables and create MapInfo queries (with a “cb_” prefix). This allows

the user to make changes to both the position of prospects and their attached information from within MapInfo.

Database Management System - DBMS (ArcGIS Users)

All mineral occurrence information is stored in CBPros1.mdb, an MSAccess database located in the Prospects subdirectory. Changes to the mineral occurrence information must be made directly to CBPros1.mdb from within MSAccess. Size and gross contained metal value can then be updated using the “Update_size_and_value” form in CBPros1.mdb.

Ordering information, copyright and disclaimer

The GreaterAntillesMap GIS database including *Geography*, *Geology*, *TS Units*, *Radiometric Dates*, *Prospect* and *Land Status* modules (in MapInfo or in ArcGIS format) is available through Recursos del Caribe, S.A. To order the database or for any questions, write to Carl Nelson at: nelson@cbmap.net.

Information on pricing is provided below. Updates are provided for free for a year and are half price for four additional years. Purchasers are encouraged to update within the five year period.

Examples of the maps that can be generated using the database are displayed on the web site at www.CBMap.net.

GreaterAntillesMap is the property of Carl E. Nelson and Recursos del Caribe, S.A. It is intended for the sole use of the purchaser. The database cannot be copied, sold, transferred, or distributed without express written permission from Carl E. Nelson.

Reasonable efforts are made to ensure that the information contained in the GreaterAntillesMap database is accurate and up-to-date. Carl Nelson and Recursos del Caribe, S.A. do not warrant the accuracy of information provided in the GreaterAntillesMap database.

Pricing

GreaterAntillesMap: a GIS database (in MapInfo or ArcGIS format) for the Dominican Republic, Cuba, Haiti, Jamaica, Puerto Rico and the Virgin Islands. Available as a package for: US\$30,000

Also available as individual modules priced as follows:

<i>Geography</i> (digital elevation models and shaded relief):	\$ 5,000
<i>Geology</i> (<i>Geography</i> plus vector geology for all 6 countries):	\$10,000
<i>Radiometric Dates</i> (radiometric dates only, with locations):	\$ 5,000

TS Units (Geography, Geology and Radiometric Dates plus a regional, peer-reviewed tectono-stratigraphic interpretation): \$20,000
Prospects (TS Units plus metallic mines and prospects): \$30,000
Land status (Geography plus metallic mineral concessions, mineral reserve areas, national parks, forest reserves and other protected areas): \$10,000

All of the modules listed above are available as a package for: \$30,000

Individual countries including all modules (*Geography, Geology, TS Units, Radiometric Dates, Prospects, and Land status*): \$10,000

Geochemistry module: multielement geochemical data, with an emphasis on stream sediment samples, is available for individual countries in the Greater Antilles. Cost is \$1 per sample for data provided as vector files, \$0.50 per sample for data that is provided as georeferenced tiff images. Sample locations have been captured and multielement geochemical data has been digitized for Panama; data capture for other countries, listed below, is underway.

Dominican Republic (over 16,000 samples as georeferenced tiff images)

Haiti (over 1000 samples as georeferenced tiff images)

Jamaica (over 10,000 samples as georeferenced tiff images)

For a more detail on the surveys that are included in each country go to: <http://www.cbmap.net/images/caribbean-stream-sediment-surveys-summary.pdf>.

GreaterAntillesMap *Geophysics*: Airborne geophysical images including raw data, as grd files. Contact nelson@cbmap.net for coverage and pricing information.
